

Fidelity Digital Health ETF

THEMATIC EQUITY

FACT SHEET MARCH 31, 2024

Symbol: FDHT • Intraday NAV Symbol: FDHT.IV • CUSIP: 316092238

OBJECTIVE: seeks to provide investment returns that correspond, before fees and expenses, generally to the performance of the Fidelity Digital Health Index.

STRATEGY: Normally investing at least 80% of assets in securities included in the Fidelity Digital Health Index and in depositary receipts representing securities included in the index.

INDEX DESCRIPTION: The Fidelity Digital Health Index is designed to reflect the performance of a global universe of companies across the market capitalization spectrum providing healthcare records management, connected healthcare devices, surgical robotics, telemedicine, and other technology-enabled healthcare products and services. Index returns are adjusted for tax withholding rates applicable to U.S. based mutual funds organized as Massachusetts business trusts (NR).

† Since fund inception, 10/5/21.

Current performance may be higher or lower than that quoted. Visit i.fidelity.com or call your investment professional for most recent month-end performance. Performance data shown represents past performance and is no guarantee of future results. Investment return and principal value will fluctuate, so you may have a gain or loss when shares are sold.

Total returns are historical and include changes in share price and reinvestment of dividends and capital gains, if any.

Net Asset Value (NAV) Return represents the closing price of underlying securities at which the fund can create and redeem shares directly with the security. **Market Return** represents the price at which an investor can buy and sell a security in the secondary market. Since ETFs are bought and sold at prices set by the market—which can result in a premium or discount to NAV—the returns calculated using market price (market return) can differ from those calculated using NAV (NAV return).

Life of fund (LOF) returns are from fund inception to indicated month-end. Note that life of fund market returns are calculated using the first day the fund traded on an exchange, which may occur a few days after the NAV inception date. For funds that have been in existence less than one year, LOF returns reflect cumulative returns since fund inception. Market returns are based on the closing price on the listed exchange at 4 p.m. ET and do not represent the returns an investor would receive if shares were traded at other times.

Standard Deviation	–
Tracking Error	–

‡ MSCI All Country World Index (Net MA)

Stock markets, especially foreign markets, are volatile and can decline significantly in response to adverse issuer, political, regulatory, market, or economic developments. Sector funds can be more volatile because of their narrow concentration in a specific industry. Digital health companies are subject to various risks, including competition, potentially rapid product obsolescence, increasing regulatory scrutiny, changes in government regulatory requirements, regulatory approval for new drugs and medical products, changes in business cycles, vulnerability to cybersecurity breaches, and unexpected events such as pandemics. Foreign securities, particularly emerging markets are subject to interest-rate, currency-exchange-rate, economic, and political risks. The value of securities of small to medium size, less well-known issuers can perform differently from the market as a whole and other types of stocks and can be more volatile than that of larger issuers. The fund may have additional volatility because it can invest a significant portion of assets in securities of a small number of individual issuers. The return of an index ETF is usually different from that of the index it tracks because of fees, expenses and tracking error. An ETF may trade at a premium or discount to its Net Asset Value (NAV).

Not NCUA or NCUSIF insured. May lose value. No credit union guarantee.

1. The top 10 holdings, sector diversification, asset allocation, country diversification, and regional diversification may not be representative of the fund's current or future investments and may change at any time. 2. As a percentage of total net assets. 3. Net Other Assets can include fund receivables, fund payables, and offsets to other derivative positions, as well as certain assets that do not fall into any of the portfolio composition categories. Depending on the extent to which the fund invests in derivatives and the number of positions that are held for future settlement, it can be a negative number.

DEFINITIONS AND IMPORTANT INFORMATION

30-Day SEC Yield is based on yield to maturity of a fund's investments and not on the dividends paid by the fund, which may differ. **Alpha** is a risk-adjusted, annualized performance measure relative to a fund's benchmark. A positive (negative) alpha indicates stronger (poorer) fund performance than predicated by the fund's level of risk measured by beta. **Beta** is a measure of the volatility of a fund relative to its benchmark index. A beta greater (less) than 1 is more (less) volatile than the index. **Expense Ratio** is the fund's total annual fund operating expenses as available in each fund's prospectus and represents the expenses that you pay each year as a percentage of the value of your investment. Any applicable brokerage charges are not included in the expense ratio. **Morningstar Averages** represent the average return of all funds within their respective fund investment category. The number of funds in each category periodically changes. Each Morningstar Average reflects the performance (excluding sales charges) of funds with similar objectives. **MSCI ACWI (All Country World Index)** is a market capitalization-weighted index that is designed to measure the investable equity market performance for global investors of developed and emerging markets. **R²** measures how a fund's performance correlates with a benchmark index's performance and shows what portion of it can be explained by the performance of the overall market/index. R² ranges from 0, meaning no correlation, to 1, meaning perfect correlation. An R² value of less than 0.5 indicates that annualized alpha and beta are not reliable performance statistics. **Relative Volatility** compares a fund's volatility to a benchmark index. A relative volatility greater (less) than 1 means the fund's returns have been more (less) variable. **Sharpe Ratio** is a risk-adjusted measure calculated using standard deviation and excess return to determine reward per unit of risk. The higher the ratio, the better the fund's return per unit of risk. **Standard Deviation** measures the historical volatility of a fund. The greater the standard deviation, the greater the fund's volatility. **Tracking Error** is the divergence between the price behavior of a position or a portfolio and the price behavior of a benchmark, creating an unexpected profit or loss. **Turnover Rate** is the lesser of amounts of purchases or sales of long-term portfolio securities divided by the monthly average value of long-term securities owned by the fund. • It is not possible to invest directly in an index. All market indices are unmanaged. • Third-party trademarks and service marks are the property of their respective owners.
